Tracsystems announces their new Campus Transaction System TracIT.

Dallas, Texas (Web Release) June 11 , 2008 – Tracsystems the market leader in Print management, Copier control devices, PC management, and Payment solutions excitedly announces the launch of their new server based network transaction system labeled **TracIT**. The TracIT product suite includes a complete point of sale/cash register solution, networked copier control terminals, and self service AddValue stations which allow users to put funds into their account using coin, cash, or a credit card. This solution integrates fully with Pharos Uniprint to offer a complete online billing solution for copy, print and point of sale transactions.

As the need for network account based transaction solutions continues to grow, Tracsystems has developed their own solution which allows Libraries, Colleges, and Universities to use existing ID cards containing a barcode, magnetic strip, or smart card chip to be used as an online account payment card.

“Many campuses across North America desire the flexibility and features of a campus transaction system yet do not have the budget to pay for the large enterprise solutions like BlackBoard or Cbord. Our TracIT package allows those schools to move to a networked account system without having the exorbitant costs of the traditional solutions.” says Tracsystems Director of Marketing, Jonathan Cave.

Tracsystems first began working with higher education customers in the mid 1980’s. With a stable history of experience in the copy and print management industry they have continually proven themselves to be an innovator for the Higher Education marketplace.
